

The probe detects only far above the corpus dose

recall of the parent answer on underdetermined items

points: measured conditions, segments imply no interpolation · labels: recall events / rows · 64x is the only dose separating from 0x (McNemar $b=17$ $c=6$, $p=0.035$)
error bars: 95% cluster bootstrap over parent problems (2000 reps) · all rows generated with vLLM 0.8.5.post1, greedy
